PROFESSIONAL SUMMARY

I help teams build reliable technical solutions by combining strong engineering fundamentals with architectural thinking, clear communication, and close collaboration with engineers and business stakeholders. Over the past several years I have worked on **healthcare, insurance, and AI platforms** where reliability, correctness, and maintainability are critical. Beyond hands-on backend development, I have taken **team leadership** and **production ownership** — coordinating engineering work, owning the path to production (CI/CD, containers, releases, monitoring), mentoring teammates, and translating business requirements into scalable solutions. Core focus: **distributed backend systems, FastAPI microservices, Kafka event-driven workflows, cloud platforms, and AI-powered product capabilities**.

CORE SKILLS

Skills: Python, FastAPI, asyncio, Django, React, TypeScript, Redux, Material UI, Team Coordination, Cross-team Collaboration, Mentoring, Code Review, Technical Leadership, Product Ownership, System Design, Microservices, Event-Driven Architecture, Kafka, PostgreSQL, Redis, Docker, Kubernetes, CI/CD, Release Management, Distributed Systems, REST APIs, AWS, GCP, Azure, Observability, Agile, LLM, RAG, OpenAI, Claude, Healthcare Technology, Insurance Platforms, B2B SaaS

Team Coordination · Mentoring

Cross-team Collaboration · Code Review

CI/CD · Production Ownership

Python · FastAPI · Django

Kafka · Redis · PostgreSQL

Docker · Kubernetes · Cloud

React · TypeScript · Material UI

Healthcare · Insurance · B2B SaaS

RAG · LLM · OpenAI · Claude

System Design · Architecture

HIGHLIGHTS

- Grew into **backend team leadership** for a five-person engineering team on a multi-tenant AI insurance product.
- Owned the path to production: containerization, CI/CD, cloud deployment, monitoring, and production troubleshooting.
- Shipped customer-facing integrations and partner APIs (KitchenHub) with external engineering/support collaboration.
- Built production **Kafka / event-driven** systems at Qantev and Oscar Health under regulated constraints.
- Owned Kubernetes releases (incl. canary) and auditability on a US health-insurance platform.
- Delivered React UIs (managerial tools + KitchenHub auth microservice) with TypeScript / Redux / Material-UI.

WORK EXPERIENCE

AI SaaS for Insurance Call Centers (B2B, Multi-tenant)

01.2025 — Present

Software Engineer

Python, FastAPI, asyncio, Django, PostgreSQL, Redis, GCP, Kubernetes, Docker, CI/CD, OpenAI, Claude, RAG, LLM, REST APIs, Observability

- Progressed from hands-on backend engineering into a technical leadership role, coordinating a **five-person engineering team**, conducting interviews, reviewing code, unblocking engineers, and working with the CEO on technical direction.
- Owned production delivery workflows, including containerization, CI/CD automation, cloud deployment, monitoring, and production troubleshooting.
- Designed and developed backend architecture for a realtime AI assistant platform: session management, event processing, low-latency workflows, and AI-powered recommendations.
- Built production AI capabilities using **RAG, LLM integrations, and human-in-the-loop** workflows for sensitive insurance operations.
- Owned implementation of **full multi-tenant isolation** — beyond database boundaries — across auth context, APIs, caches, queues, and storage paths to prevent cross-tenant data leakage.
- Delivered **real-time** call-session pipelines (live event/audio intake and operator suggestions) under strict latency constraints.
- Deployed platform services into **restricted / private network environments** for regulated insurance workloads (VPC isolation, controlled egress, non-public service access).

Software Engineer (Backend / Python)

Python, FastAPI, asyncio, Django, PostgreSQL, Kafka, Azure (AKS, Blob, Service Bus), REST APIs, Microservices, LLM

- Participated in architecture decisions for a new insurance platform — evaluating trade-offs and shaping long-term system direction while evolving existing production systems.
- Participated in product grooming sessions, technical planning, and product demos, helping translate business requirements into technical solutions.
- Collaborated with stakeholders during platform planning, technical grooming, and product demonstrations.
- Led **Django** → **FastAPI** migration while maintaining production stability and improving service boundaries; led code reviews and engineering discussions.
- Built backend workflows for claims processing, document intelligence, and healthcare integrations (Kafka status streams, partner webhooks, antifraud signals with human override).
- Worked with insurance claims/document **data formats and partner interchange contracts** across integrations and status-exchange flows.
- Built antifraud/AI assistance with **confidence scoring** and mandatory human override — treating model outputs as estimates that must defer to operators on high-risk steps.

Software Engineer (Backend / Python)

Python, Go, Kafka, gRPC, AWS (EKS, RDS, S3), Kubernetes, ArgoCD, Canary Releases, PostgreSQL, React, Material UI, Microservices

- Designed distributed services for eligibility, benefits, and member-management workflows on a large digital health insurance platform.
- Owned Kubernetes deployment on AWS EKS, including **canary releases**, and strengthened auditability for sensitive healthcare workflows.
- Built managerial-unit UI interfaces in **React and Material UI** for internal operational tools used by business teams.
- Worked on high-throughput **event-driven systems** supporting Open Enrollment peaks and sensitive healthcare data paths.
- Supported production systems, investigated incidents, and worked across engineering and external partners to resolve reliability and integration issues.
- Contributed to a **Go** → **Python** migration of critical pipeline stages.
- Worked with healthcare eligibility/benefits **data formats and partner interchange standards** on regulated member-data paths.
- Operated services in **restricted network environments** typical of regulated healthcare platforms (private cluster networking, controlled access paths).

Software Engineer (Backend / Full-stack)

Python, FastAPI, asyncio, GCP, Redis, Docker, REST APIs, OpenAPI, React, TypeScript, Redux, React Router, Material-UI, Webpack, Axios, Partner API Integrations

- Owned integrations with Uber Eats, Grubhub, and GloriaFood — shipping partner-facing APIs used across restaurant and delivery workflows.
- Built a React frontend microservice for authorization in partner integrations (TypeScript, Redux, React Router, Material-UI, Webpack, Axios).
- Worked directly with external partner engineering and support teams to resolve API changes, incidents, rate limits, and integration issues.
- Designed distributed workflows to improve consistency across external systems (retries, idempotency, orchestration).
- Defined and evolved versioned partner API contracts and **engineering data formats** (OpenAPI) used across external delivery providers.
- Implemented **distributed transaction** patterns (saga-style orchestration) and mixed **synchronous / asynchronous** microservice communication across partner integration services.

TECHNICAL SKILLS

Languages	Python (primary), Go (production microservices)
Leadership / Product	Team coordination, cross-team collaboration, mentoring, code review, hiring, product grooming/demos, stakeholder communication
Backend	FastAPI, asyncio, Django/DRF, Pydantic, SQLAlchemy, REST APIs, OpenAPI, microservices
Frontend	React, TypeScript, Redux, React Router, Material UI / Material-UI, Webpack, Axios
Architecture	System design, event-driven systems, distributed systems, API design, production ownership
Data / Events	PostgreSQL, Redis, Kafka, gRPC, GCP Pub/Sub, Azure Service Bus
AI / LLM	RAG, OpenAI, Claude, retrieval pipelines, human-in-the-loop workflows
Cloud / DevOps	AWS, GCP, Azure, Docker, Kubernetes, ArgoCD, canary releases, CI/CD, release management, observability, production support
Domains	Healthcare technology, insurance platforms, regulated systems, B2B SaaS, partner integrations

EDUCATION

Computer Networks and Systems — Software Engineer degree
Relevant focus: software engineering, networks, systems
