PROFESSIONAL SUMMARY

Software delivery leader with a **7+ year engineering foundation** (full-stack and backend in Python, React, cloud, and distributed systems) and **2+ years** growing into people leadership within **Agile** environments (Scrum/Kanban). Career arc: integrations and health-insurance platforms → architecture and migration ownership → leading a five-engineer team with hiring, coaching, PDPs, and client delivery accountability. Experienced in **recruitment, competency building, resource planning**, and engineering standards across regulated **healthcare and insurance SaaS**.

CORE SKILLS

Skills: People Management, Team Leadership, Talent Acquisition, Recruitment, Hiring, Onboarding, Competency Development, Skills Matrix, Personal Development Plans, Coaching, Mentoring, Performance Feedback, Career Development, Knowledge Management, Learning & Development, Resource Planning, Capacity Planning, Delivery Management, Client Relationship Management, Stakeholder Management, Project Scheduling, Prioritization, Risk Management, Issue Resolution, Agile, Scrum, Kanban, Software Engineering Standards, Technical Governance, Code Review, Release Management, B2B SaaS, Healthcare, Insurance, Partner Integrations, Python, Cloud Technologies, AWS, GCP, Azure, Kubernetes, CI/CD, Microservices, Distributed Systems

- Talent Acquisition · Hiring
- Competency · PDP · Coaching
- Team Leadership · 1:1s
- Delivery · Client Management
- Agile · Scrum · Kanban
- Resource · Capacity Planning
- Knowledge Management · L&D
- Engineering Standards · Governance
- Stakeholder Communication
- Python · Cloud · Kubernetes

LEADERSHIP HIGHLIGHTS

- Progressed from **full-stack and backend engineering** (integrations, health insurance, insurtech) into **team leadership** on a multi-tenant B2B AI SaaS product.
- Owned architecture and delivery on regulated platforms: Kafka event streams, Kubernetes releases, multi-tenant isolation, and partner API integrations.
- Established engineering governance on current product: Agile cadence, CI/CD gates, observability, and client delivery accountability with executive stakeholders.
- Currently lead a **five-engineer team** — hiring, interviews, onboarding, 1:1s, PDPs, and growing the team's **Python competency**.
- At Qantev, combined hands-on engineering with grooming, migration leadership, and code-review standards — first clear step toward people and delivery ownership.
- Strong client and partner communication track record across B2B insurers and delivery integrations.

WORK EXPERIENCE

AI SaaS for Insurance Call Centers (B2B, Multi-tenant)

01.2025 — Present

Software Delivery Lead

Team leadership, hiring, competency building, Agile/Scrum · Python, FastAPI, Django, PostgreSQL, Redis, GCP, Kubernetes, Docker, CI/CD, OpenAI, Claude, RAG, REST APIs, Observability

- Grew from hands-on engineering into leading a **five-person engineering team** — hiring roadmap, role profiles, technical interviews, onboarding, and structured **1:1 coaching** with personal development plans for key engineers.
- Build the team's **Python engineering competency**: skill expectations, knowledge-sharing sessions, review standards, mentoring senior/junior pairs, and tracking growth through regular feedback.
- Own **resource and delivery planning** with the CEO — translate business priorities into sprint backlogs, release schedules, and measurable outcomes for B2B insurance clients.
- Set team-level **engineering governance**: Agile ceremonies, code-review policy, CI/CD quality gates, observability, and incident playbooks; unblock engineers and keep delivery predictable without becoming a single point of failure.
- Act as delivery owner for client releases — manage expectations, supervise rollout readiness, review deliverables, and drive defect resolution with product and operations stakeholders.
- Still hands-on on critical paths when needed: multi-tenant SaaS architecture, realtime event pipelines, RAG/LLM workflows with human-in-the-loop controls, and private-cloud deployments for regulated workloads.

Software Engineer (Backend / Python)

Python, FastAPI, asyncio, Django, PostgreSQL, Kafka, Azure (AKS, Blob, Service Bus), REST APIs, Microservices, LLM

- Hands-on backend engineer on a new insurance platform — with growing ownership of **architecture discussions, grooming, and engineering coordination** alongside IC work.
- Participated in product grooming, technical planning, and demos — translating business requirements into delivery plans and helping align engineers with stakeholder expectations.
- Led the **Django → FastAPI migration** stream: service boundaries, async handlers, OpenAPI contracts, and code-review standards while keeping production stable.
- Designed and built claims-processing workflows — Kafka status streams, partner webhooks, document intelligence, and antifraud signals with mandatory human override.
- Drove integration and defect resolution across partner interchange formats and status-exchange flows.
- Stepped into informal tech-lead responsibilities: mentoring teammates, facilitating review quality, and onboarding engineers joining the backend stream — clear progression toward people leadership.

Software Engineer (Backend / Python)

Python, Go, Kafka, gRPC, AWS (EKS, RDS, S3), Kubernetes, ArgoCD, Canary Releases, PostgreSQL, React, Material UI, Microservices

- Designed and built distributed services for eligibility, benefits, and member-management workflows on a large digital health-insurance platform.
- Owned Kubernetes deployment on AWS EKS, including **canary releases**, and strengthened auditability for sensitive healthcare workflows.
- Built internal operational UIs in **React and Material UI** for business teams managing member and benefits workflows.
- Engineered high-throughput **event-driven pipelines** (Kafka) through **Open Enrollment** seasonal peaks on regulated member-data paths.
- Contributed to a **Go → Python** migration of critical pipeline stages; optimized cross-service gRPC traffic and production hot paths.
- Supported production incidents and partner integrations; worked with healthcare eligibility/benefits data formats and interchange standards in restricted network environments.

Software Engineer (Backend / Full-stack)

Python, FastAPI, asyncio, GCP, Redis, Docker, REST APIs, OpenAPI, React, TypeScript, Redux, React Router, Material-UI, Webpack, Axios, Partner API Integrations

- Full-stack engineer owning production integrations with Uber Eats, Grubhub, and GloriaFood — partner-facing APIs used across restaurant and delivery workflows.
- Built a React authorization microservice for partner integrations (TypeScript, Redux, React Router, Material-UI, Webpack, Axios).
- Developed FastAPI backend services: async handlers, Redis caching, Dockerized deploys on GCP, and OpenAPI-documented REST contracts.
- Designed resilient distributed workflows — retries, idempotency, saga-style orchestration, and mixed sync/async microservice communication across providers.
- Worked directly with external partner engineering teams on API changes, outages, rate limits, and integration incidents.
- Defined versioned partner API contracts and engineering data formats (OpenAPI) shared across delivery-provider adapters.

LEADERSHIP & ORGANIZATION SKILLS

People & Organization	Team leadership, 1:1s, coaching, motivation, performance feedback, personal development plans, competency building, skills matrix, talent acquisition, recruitment, interviews, onboarding, knowledge management, mentoring programs
Delivery & Clients	Resource planning, capacity planning, sprint/backlog prioritization, release management, client relationship management, stakeholder alignment, delivery reviews, expectation management, issue/defect resolution, risk management
Process & Governance	Agile, Scrum, Kanban, engineering standards, technical governance, code-review culture, CI/CD governance, incident response, cross-team coordination
Technical Foundation	7+ years software engineering background; strong familiarity with Python ecosystems, cloud platforms (AWS, GCP, Azure), Kubernetes, microservices, and regulated SaaS delivery — used to set standards and evaluate team output, not as primary IC focus
Domains	B2B SaaS, healthcare technology, insurance platforms, regulated systems, partner integrations, AI-assisted product delivery

EDUCATION

Computer Networks and Systems — Software Engineer degree
Relevant focus: software engineering, networks, distributed systems

AVAILABILITY

Full-time · Remote from Georgia · Open to people leadership & software delivery management roles.
