

Maksim Vasilenka

Senior Python Engineer · Backend & AI Systems

Remote (worldwide) · pinkpanterpython3@gmail.com · Telegram: @maksimvasilenko11

Public code: github.com/easylager/pulsebridge

I build reliable Python backend systems that are designed for production, not just demos. Six-plus years across regulated health insurance platforms, insurtech claims and antifraud, realtime AI assistants and multi-partner integrations — the kind of systems where a wrong status or a hallucinated answer costs real money.

SERVICES

Backend architecture & APIs

REST services on FastAPI and Django/DRF, async processing, service boundaries, OpenAPI contracts, migrations on live systems without downtime.

AI agents, RAG & LLM integration

Multi-step agent workflows with tool calls, retrieval over your documents (embeddings, pgvector), guardrails and human-in-the-loop on risky steps.

Distributed & event-driven systems

Kafka, Redis Streams, Pub/Sub, Service Bus: idempotent consumers, retries, back-pressure, versioned contracts between services.

External API integrations

Partner and vendor integrations with rate limits, retries, reconciliation and graceful degradation when the other side fails.

Cloud, delivery & observability

Docker, Kubernetes, GitLab CI/CD and GitHub Actions on AWS, GCP and Azure; Prometheus, Grafana and Sentry wired into the flows that matter.

Technical consulting & review

Architecture review, trade-off analysis (quality vs cost vs latency), code review standards, ADRs and onboarding documentation.

SELECTED PRODUCTION WORK

- **Realtime AI assistant (B2B SaaS, insurance call centers)** — agent workflows with tools and session context, production RAG (ingest, embeddings, pgvector retrieval), STT→LLM pipelines with guardrails, multi-tenant isolation, GCP Pub/Sub workers and Kubernetes delivery.
- **Claims & antifraud SaaS (international, B2B)** — document intake and review backend, antifraud signals with human override, Kafka status events, idempotent partner webhooks, Airflow batch/ETL, live Django→FastAPI migration.
- **US health insurance platform (regulated, high load)** — multi-service eligibility and member-data pipelines on Kafka and gRPC, seasonal peak readiness, AWS EKS with ArgoCD, least-privilege and audit-friendly practices, production incident support.
- **Delivery integrations platform** — one internal contract over several partner APIs, saga-style order/status consistency, retries, rate limits, idempotency, GCP reconciliation jobs.

CORE STACK

HOW I WORK

- Start from failure modes: what breaks, who notices, and how the system degrades safely.
- Correctness first on money, status and compliance paths — idempotency, audit trails, retries.
- Explicit trade-offs between quality, cost, latency and long-term maintenance cost.
- Observability and tests shipped with the feature, not bolted on after the first incident.
