

Hi Lazer team,

I'd like to apply for the Senior DevOps/SRE Engineer (AWS/GCP) position.

I'll be direct — this is one of the best job posts I've read in a long time. Real infra ownership, production AI, varied client work, senior people — that's the mix I've been looking for. I want to join Lazer specifically, not just land another remote DevOps gig.

A lot of where I'm strong comes from health tech. At Oscar Health (US health insurance) and Qantev (insurtech / health outcomes) I worked in HIPAA-aware setups — member PHI, clinical and claims data, tight access controls, audit pressure, and systems that really can't fail quietly during Open Enrollment or heavy document-processing weeks.

On my current AI SaaS project I'm **Staff Engineer / DevOps** — not just app features: GCP deploy layout, Docker, Pub/Sub workers, observability, and keeping LLM pipelines sane in production.

I've also spent 4+ years in outstaff/consulting delivery for US/EU product teams — fast onboarding, different stacks, owning prod from deploy through incidents. At Oscar I rewrote a **Go service to multi-threaded Python** and worked next to a **Node.js BFF** in a polyglot K8s stack.

On the platform side: AWS & GCP, Kubernetes (ArgoCD), Docker, Cloud Run, Pub/Sub queues, Aurora/RDS, CI/CD, Prometheus/Grafana, Python/Go/Bash automation. Plus fintech (payment rails) and high-volume partner integrations (Uber Eats, Grubhub, GloriaFood, DoorDash).

Match (on CV): Staff Engineer/DevOps · 6+ years production · outstaff/consulting · Oscar Health + Qantev ·

HIPAA / SOC 2 · Go · Node BFF · AWS & GCP · K8s · Docker
· CI/CD · LLM in prod · remote · B2 English.

Happy to walk through a health-tech rollout or AI pipeline
ops setup on a short call if useful.

Best regards,
Maksim Vasilenka
