

Hi Torrero team,

I'd like to apply for the Middle to Senior Python Developer (Risks & Compliance) position.

I'm a hands-on Python/Django engineer — 6+ years of commercial backend work, coding myself day to day. Most of my depth is in regulated, business-critical products rather than iGaming specifically: US health insurance (HIPAA), insurtech claims/document flows, payments, and SOC 2-oriented controls. The problems rhyme with compliance backends: sensitive data, audit pressure, integrations, and things that cannot fail quietly in production.

Your stack fits what I've used in anger: Python, Django, PostgreSQL, Redis, queue-backed workers. I haven't shipped RabbitMQ/MongoDB as primary stores in production, but I'm comfortable with SQL/NoSQL trade-offs and message-driven architectures (Celery, Pub/Sub, async workers). Happy to ramp quickly on your exact queue/DB mix.

What I bring: architectural decisions on backend, tests, production monitoring, performance tuning on high-load paths, and decomposing large compliance features into shippable pieces. Fast-paced startup pace is normal for me — current role is a startup, plus I run my own product on the side.

Match (on CV): 6+ years Python · Django/DRF · PostgreSQL · Redis · regulated domains · high-load · native Russian · English B2 · fully remote.

Happy to walk through one compliance-heavy backend feature end-to-end on the intro call.

Best regards,
Maksim Vasilenka
Minsk, Belarus
