

Hi Betby team,

I'd like to apply for the **Python Developer** role.

Your stack is a direct match for what I've been building for years: **asyncio**, **FastAPI**, **Kafka**, microservices, internal **RPC**, and backends that must stay correct under spikes — not legacy maintenance, but continuous module development and hardening. That's the work I want.

Where I'm strongest. Production **Kafka** at Qantev and Oscar (event-driven pipelines, consumer groups, idempotent handlers, peak load). **FastAPI + asyncio** across Qantev, Kitchenhub, and my current B2B platform — including a live **Django → FastAPI** migration without downtime. Internal **gRPC/RPC** at Oscar. High-volume partner integrations at Kitchenhub (Uber Eats, DoorDash, Grubhub). Payment-critical paths with race/duplicate protection on a marketplace backend — fintech-adjacent, latency- and consistency-sensitive workloads similar to transactional betting flows.

Honest gaps. I haven't worked in sportsbook/iGaming yet. I do have regulated high-load backends (insurance, payments, peak enrollment traffic) and I'm motivated to apply that to Betby's domain. Primary broker experience is **Kafka** in production; I also used **Azure Service Bus** and **Pub/Sub** with pub/sub, RPC-style handlers, retries, and DLQ patterns — I'm ready to go deep on **RabbitMQ** specifics on your stack. PostgreSQL is my main store; document workloads included **GCP Datastore** — MongoDB semantics are familiar, ready to ramp on your schemas.

Remote from Belarus (worldwide), English B2+, Russian native. CV attached.
