

Hi Shippo team,

I'd like to apply for the **Senior Backend Engineer (Logistics)** role.

Shippo's problem space — reliable shipping infrastructure, high-volume APIs, and integrations with external carriers — maps closely to what I've been doing in adjacent domains: **partner/carrier-style APIs** at Kitchenhub (Uber Eats, DoorDash, Grubhub), **status and webhook pipelines** at Qantev (Kafka), and **peak-load processing** at Oscar Health on AWS with gRPC and strict uptime expectations.

Why I'm a strong match. 8+ years of server-side work in **Python** and **Django**, with deep **SQL** (PostgreSQL tuning, migrations, hot-path optimization). I refactor existing systems for scale — not only greenfield — and ship with **pytest** coverage, code review, and production incident discipline. **Microservices**, **REST**, **gRPC**, and **Kafka** in production; **AWS** and **Kubernetes** in daily delivery.

Honest gap: I haven't worked directly on postal address validation or package tracking yet. The integration patterns are familiar — normalize external provider contracts, track state transitions, retry safely, keep APIs fast under load — and that's the work I want to do at Shippo's scale.

Remote from Belarus (global), English B2+. CV attached.
